

End of Day (EOD) Report

Date: 24 July 2026

Accomplishments

- I installed OpenStack on VM and updated its storage to fix full disk errors and to further setup multiple VMs inside OpenStack.
- In kodecloud ansible task I created a ini file for a server to set up ssh authentication to disable host key checking.
- Created a VM inside Azure VM, used az vm create to build an Ubuntu 24.04 LTS instance and tested it with SSH login.
- In aws vm, created a security group and added inbound rules for http and ssh.
- In MLOps track, created a python virtual environment and installed some libraries and added the dependencies in a requirement.txt file in KodeKloud task.

Challenges

- The current challenge I am facing is when created new instances on OpenStack I cant upload linux disc images because of large file size, So I have to find an alternative to install the vms needed.

Next Steps

- Work on the OpenStack issue and do my daily KodeCloud Tasks.

Regards,

Mohsin Rasul
