

End of Day (EOD) Report

Date: 8 June 2026

Accomplishments

- I did my research on threat intelligence and started working on reactive threat hunting.
- Successfully configured Snort in daemon mode for continuous network traffic monitoring.
- Integrated Snort alert logs into Splunk Enterprise for centralized data and visualization.
- Created a report on Threat Hunting. [Report](#)
- I learned about OSI model and TCP/IP model.
- Captured the network and analyzed different protocols using Wireshark. [Tasks](#)
- I did my research on a open source tool like nesses which is OpenVAS which is based on the last free version of Nessus.

Challenges

- I faced challenges in snort detection then later found out the problem was listing but wasn't updating the logs.
- In Splunk I had to renew the free license I had to access the dashboard.

Next Steps

- Get a large data set as logs for Splunk to detect the anomalies using the query.
- Improve threat detection and focus on proactive threat hunting.
- Integrate Ai to analyze these anomalies to prevent an attack before it happens.
- Automate the snort and Splunk setup at startup.

Status

In Progress – The OpenVAS tool implementation is still in progress have to implement inside docker or normally in ubuntu.

Regards,

Mohsin Rasul
