

End of Day (EOD) Report

Date: 09 July 2026

Accomplishments

- I successfully deployed OpenVAS open-source vulnerability assessment tool using docker compose.
- Did the network scan of the VM in NAT mode finding some minor vulnerabilities.
- Created a routed/switched topology in Cisco Packet Tracer, including the setup of three routers and two LAN subnets. [Task](#)
- Implemented OSPF and DHCP in the small network topology.
- Did some research about how VLANs are implemented in Mininet and firewalls like pfSense.
- Learned about the basic concepts like HTTP/HTTPS, SSH, VPNs, VLANs and firewall.
- Coded some basic python programs in VS Code.

Challenges

- There were some issues while accessing the OpenVAS dashboard which were resolved using http instead of https because of ssl certificate mismatch and GMS verification error which was resolved waiting for a while and checking status of the services confirming everything is up.
- Some difficulty in installing pfSense in VMware.

Next Steps

- Do a full network scan of home network and try to fix the vulnerabilities.
- Use the OpenVAS dashboard for scheduled reports daily or weekly.
- More work on firewall like pfSense.

Status

In progress – Base setup and vulnerability assessment is completed, will test this on a vulnerable application and the final report compilation.

Regards,

Mohsin Rasul
