

End of Day (EOD) Report

Date: 27 July 2026

Accomplishments

- I installed ubuntu-server 26 and created an instance inside openstack and built a small network topology for testing.
- Added private ssh key and opened port 22 in security groups and allocated a floating ip to test the instance.
- Completed KodeKloud tasks of linux user administration.
- In tasks of cloud track, in task had to disable root login over ssh on all app servers.
- Then in the azure track, created a vm with the given specifications and verified that it is running.

Challenges

- The instance inside openstack keeps getting stuck and boot and connection issues, have to allocate more resources so it properly boots.

Next Steps

- Fix the instance or create a clean instance and reconfigure everything and also add authentication for openstack dashboard.

Regards,

Mohsin Rasul
