

End of Day (EOD) Report

Date: 30 July 2026

Accomplishments

- Successfully booted and logged into an Ubuntu instance inside OpenStack after resolving system initialization and boot hang issues.
- Configured cloud-init customization scripts for automated user creation and password-based SSH access management.
- Completed KodeKloud lab tasks covering Cloud, Linux Administration, AWS, and Azure.

Challenges

- Experienced boot stalls, where were resolved by giving more ram and a hard boot inside openstack vm console.
- Had DNS resolution failures, which was caused by missing dns configuration on default subnet.

Next Steps

- Build an isolated private tenant network.
- Deploy and configure an OpenStack virtual router to bridge the private tenant network with the external provider network.
- Launch the Ubuntu instance on the private tenant network, attach a Floating IP, and execute automated deployment scripts.

Regards,

Mohsin Rasul
